

CCS Site Characterization Program

Characterization of Most Promising Carbon Capture and Sequestration Formations in the Central Rocky Mountain Region (RMCCS)

Recovery Act Site Characterization Projects Kick-Off Meeting

February 3-4, 2010
Pittsburgh, PA

Acknowledgements

- Many thanks to the U.S. Department of Energy and NETL for supporting this project
- We express our gratitude also to our many industry partners, who have committed a great deal of time, funding and other general support for these projects
- The work presented today is co-authored by Brian McPherson and Vince Matthews, with contributions from many partners in the RMCCS project

Presentation Outline

- Major Goals and Context (Why)
- Outcomes and Deliverables (What)
- Project Team and Plan (How)
- Budget and Cost-Share

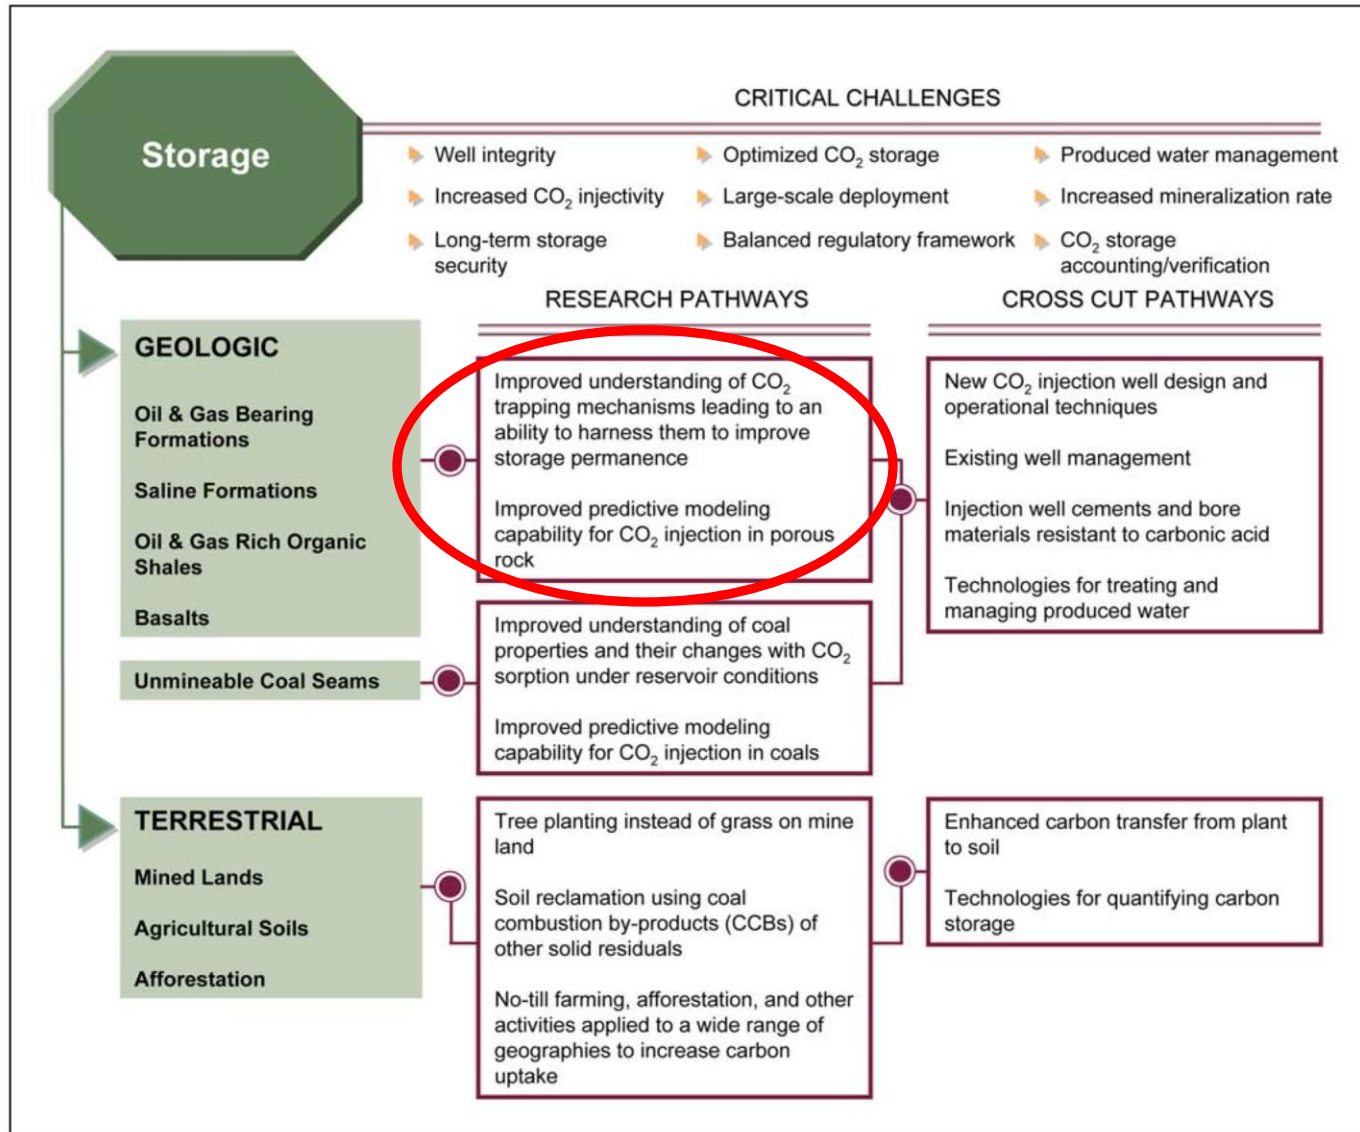

Major Goals and Context

Broad Goals: “The goals are focused on reservoir characterization, storage potential, and large-scale injection, which are tied directly to the Program goal of achieving 99 percent storage permanence.”

- *NETL Carbon Sequestration Technology Roadmap and Program Plan*

Major Goals and Context

Major Goals and Context

Regional Goal:

Thoroughly
characterize the most
promising geologic
storage targets within
the southwestern U.S.
and the Central Rocky
Mountain region in
particular.

Major Goals and Context

Regional Goal:
Thoroughly characterize the most promising geologic storage targets within the southwestern U.S. and the Central Rocky Mountain region in particular.

Period	Formation / Member		Thickness (feet)	Lith.
CRET	Mancos Shale	Blue Gate Sh	4800	
		Frontier Ss	100	
		Mowry Shale	30	
	Dakota Sandstone		75	
	Cedar Mtn Fm	Upper member	75	
		Buckhorn Cg Mbr	40	
JURASSIC	Morrison Formation		600	
	Curtis / Summerville		100	
	Entrada Formation		130	
	Carmel Formation		70	
	Navajo Sandstone		650	
TRIASSIC	Chinle Fm	Upper member	150	
		Gartra Grit Mbr	60	
	Moenkopi Fm		500	
PERM	Park City Fm		150	
PENN	Weber Sandstone		900

Reservoir

Major Goals and Context

Some Specific Technical Goals:

- (1) optimization of **capacity estimation**
- (2) optimization of **monitoring design** - especially effective spatial coverage and survey/measurement frequency
- (3) optimization of **simulation models** - especially alignment of spatial and temporal scales of models with those of monitoring technologies
- (4) optimization of **risk assessment**

We anticipate that explicit focus on improving characterization methodologies can create major improvements of these four critical CCS activities.

Presentation Outline

- Major Goals and Context (Why)
- Outcomes and Deliverables (What)
- Project Team and Plan (How)
- Budget and Cost-Share

Expected Outcomes

First and foremost, the tasks, major activities, and deliverables:

Task 1.0 Project Management

- Updated Project Management Plan
- NEPA and permitting
- Education and Outreach begins
- Copies of all permits, including summary topical report of acquisition protocols

Task 2.0 Assess Regional Significance of the Dakota, Entrada, and Weber Formations

- Gather all available data, esp. but not limited to public information
- Regional Models and Analyses
- Evaluate Regional Capacity and Significance (Topical Report)
- Update national databases

Task 3.0 Site-Specific Evaluation of the Dakota, Entrada, and Weber Formations

- Drill, Log and Core Deep Well
- Evaluate and Report Sequestration Capacity of Most Promising Formations (Topical Report)
- Develop and Apply Simulation Model Analysis of Most Promising Formations

Task 4.0 Conduct Risk Assessment

- Risk Registry for Case Study Site
- Evaluate and Report on Risk Assessment and Mitigation Strategies (Topical Report)

Task 5.0 Final Site Characterization Plan and Protocols

- Finalize Characterization of Most Promising CCS Geologic Formations (Topical Report)
- Final Site Characterization Plan and Protocols Document (Formal and Published)

Task 6.0 Develop a well bore management and mitigation strategy

- Same deliverables as listed under task 4

Task 7.0 Optimize Reservoir Engineering to Maximize CO₂ Injection/Produced Fluid Beneficial Use

- Develop and Report on Reservoir Engineering Optimization Strategies (Topical Report)

Expected Outcomes

First and foremost, the deliverables:

Task 1.0 Project Management

- Updated Project Management Plan
- NEPA and permitting
- Education and Outreach begins
- **Copies of all permits**, including summary topical report of acquisition protocols

Task 2.0 Assess Regional Significance of the Dakota, Entrada, and Weber Formations

- Gather all available data, esp. but not limited to public information
- Regional Models and Analyses
- Evaluate **Regional Capacity and Significance (Topical Report)**
- **Update national databases**

Task 3.0 Site-Specific Evaluation of the Dakota, Entrada, and Weber Formations

- Drill, Log and Core Deep Well
- Evaluate **Sequestration Capacity of Most Promising Formations (Topical Report)**
- **Simulation Model Analysis of Most Promising Formations (Topical Report)**

Task 4.0 Conduct Risk Assessment

- **Risk Registry for Case Study Site**
- Develop **Risk Assessment and Mitigation Strategies (Topical Report)**

Task 5.0 Final Site Characterization Plan and Protocols

- Finalize Characterization of Most Promising CCS Geologic Formations (Topical Report)
- **Final Site Characterization Plan and Protocols Document** (Formal and Published)

Task 6.0 Develop a well bore management and mitigation strategy

- Same deliverables as listed under task 4

Task 7.0 Optimize Reservoir Engineering to Maximize CO₂ Injection/Produced Fluid Beneficial Use

- Develop and Report on **Reservoir Engineering Optimization Strategies (Topical Report)**

Expected Outcomes

Some Critical Technical Goals and Outcomes:

- optimization of capacity estimation

Expected Outcomes

Optimize Capacity Estimation: Number of Years for Specific Sources

Annual mass of CO₂ emissions from power plants, in million tons per year (Mt/y)

EXAMPLE: Regional Emissions

Point Sources :

~318 million tons CO₂ per year

UB Major Basins

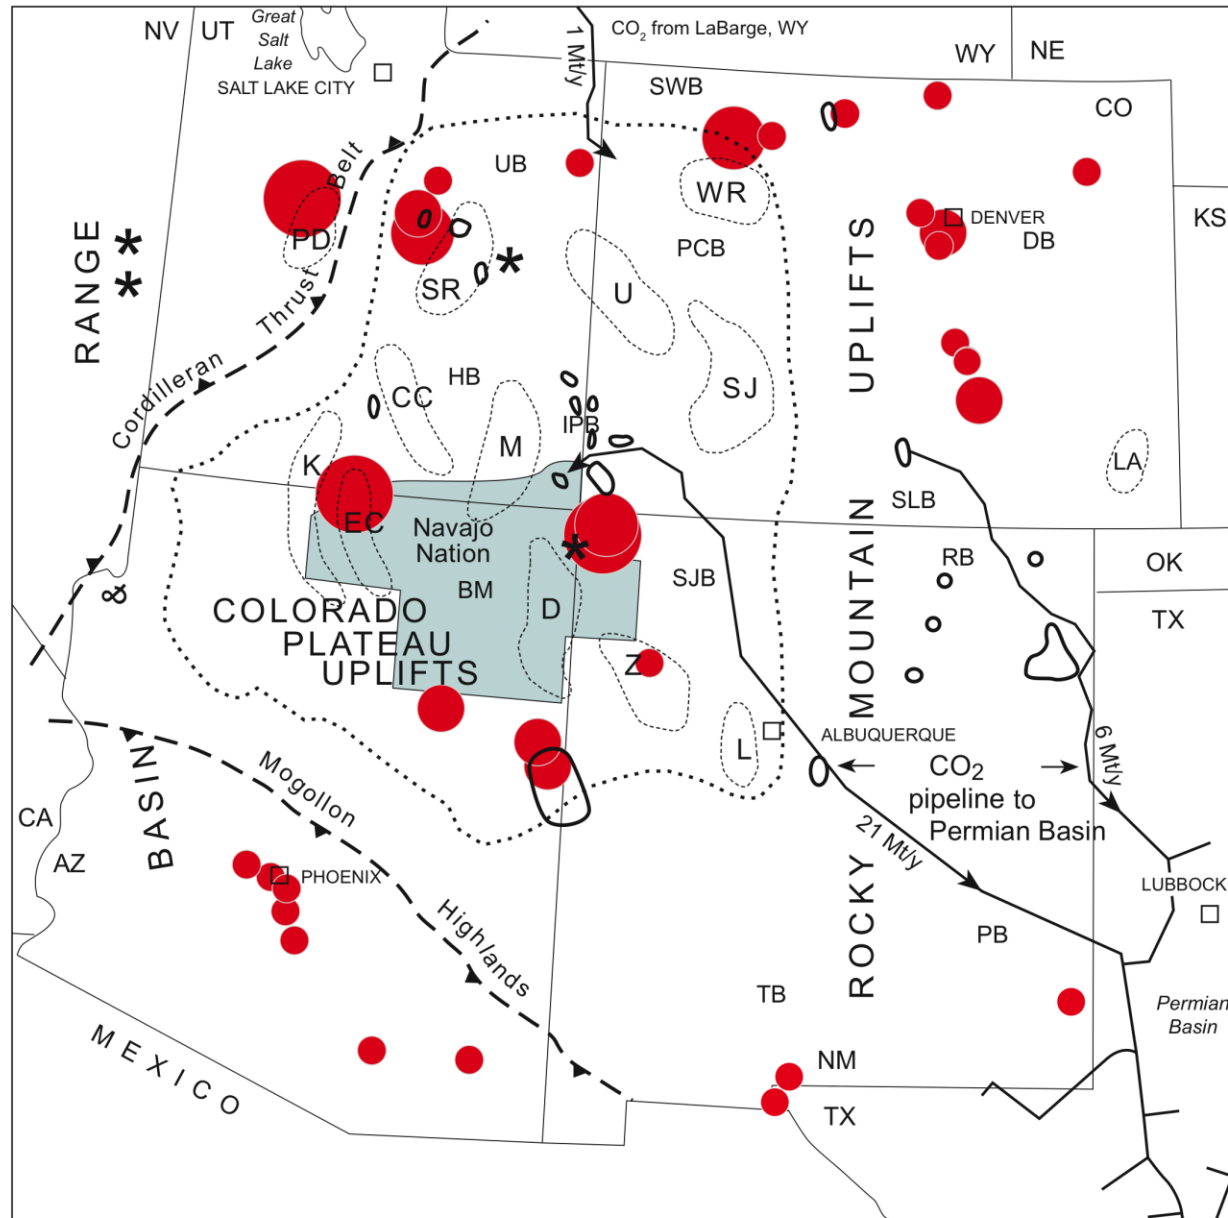

100 km

Major uplifts

100 miles

CO₂ pipeline (flow in million tons per year)

* Proposed coal-fired power plants

Expected Outcomes

Case Study Area

Optimize Capacity Estimation:
Number of Years for Specific Sources

Annual mass of CO₂ emissions from power plants, in million tons per year (Mt/y)

EXAMPLE: Regional Emissions

Point Sources :

~318 million tons CO₂ per year

UB Major Basins

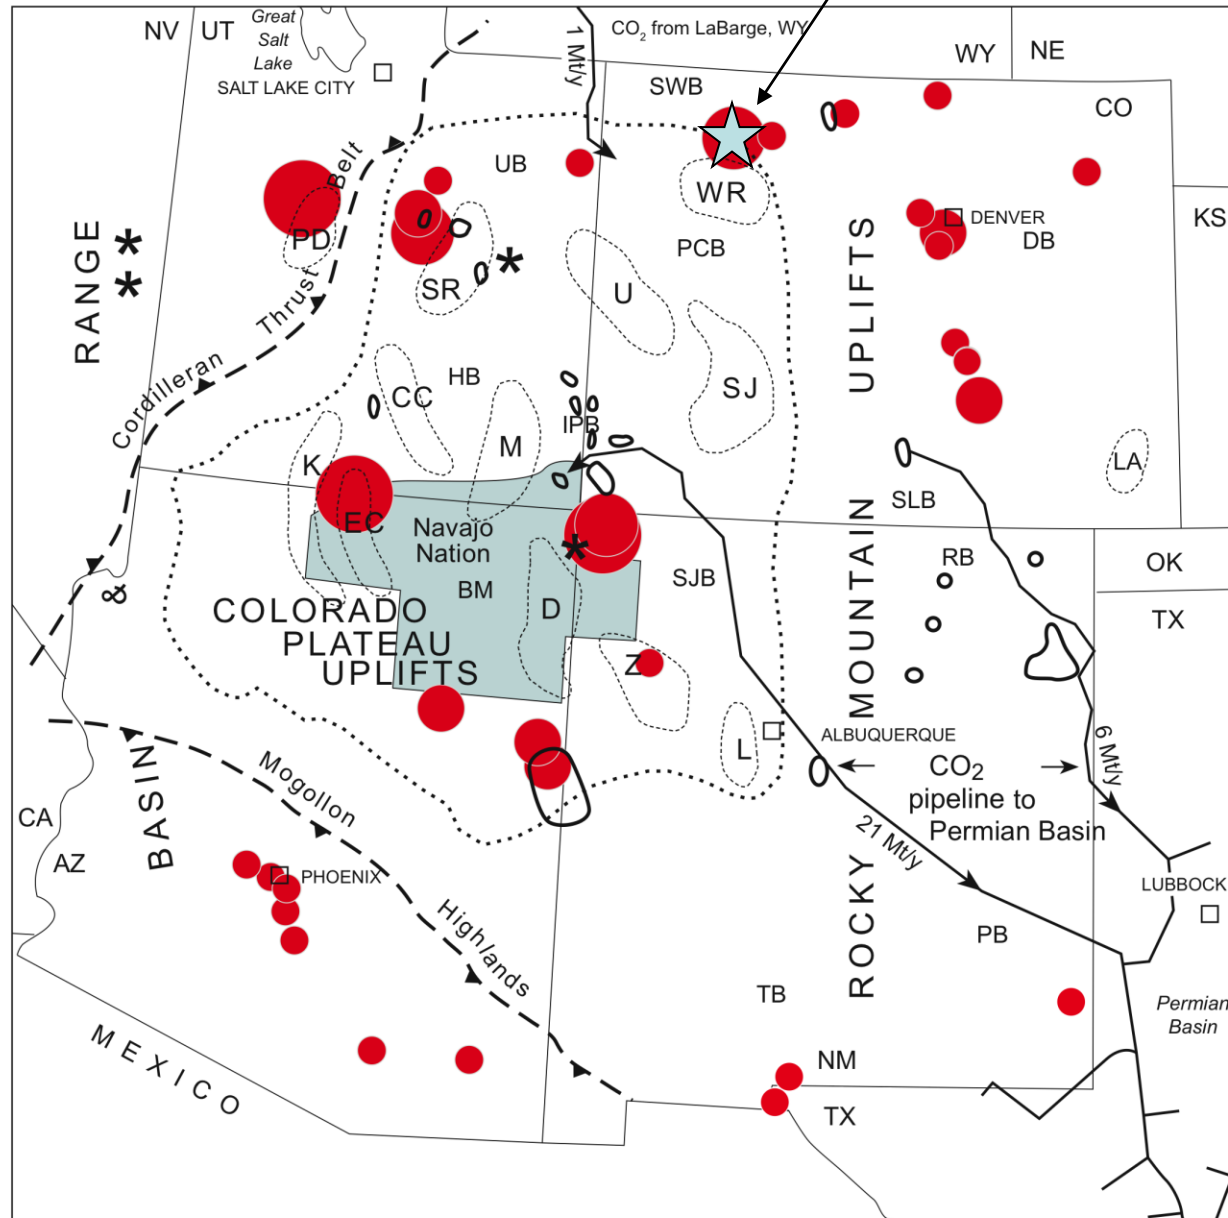

100 km

Major uplifts

100 miles

CO₂ pipeline (flow in million tons per year)

* Proposed coal-fired power plants

Expected Outcomes

Optimize Capacity
Estimation:
Number of Years for
Specific Sources

From Atlas II:

Saline Formation CO ₂ Storage Resource by State (million metric tons)		
State	Low CO ₂ Storage Resource	High CO ₂ Storage Resource
Arizona	199	752
Colorado	18,828	75,313
Kansas	8	9
Nebraska	87	348
New Mexico	33,054	132,215
Oklahoma	2	9
Texas	11,700	46,800
Utah	24,934	99,305
Wyoming	4,909	19,636

EXAMPLE: Regional Emissions
Point Sources :

~318 million tons CO₂ per year

700,000 million metric tons

318 million metric tons/yr

≈ 2,200 years

Maximum estimated SW saline capacity:
700,000 million metric tons

Expected Outcomes

Optimize Capacity
Estimation:
Number of Years for
Specific Sources

Example: CO₂ Emissions in Colorado

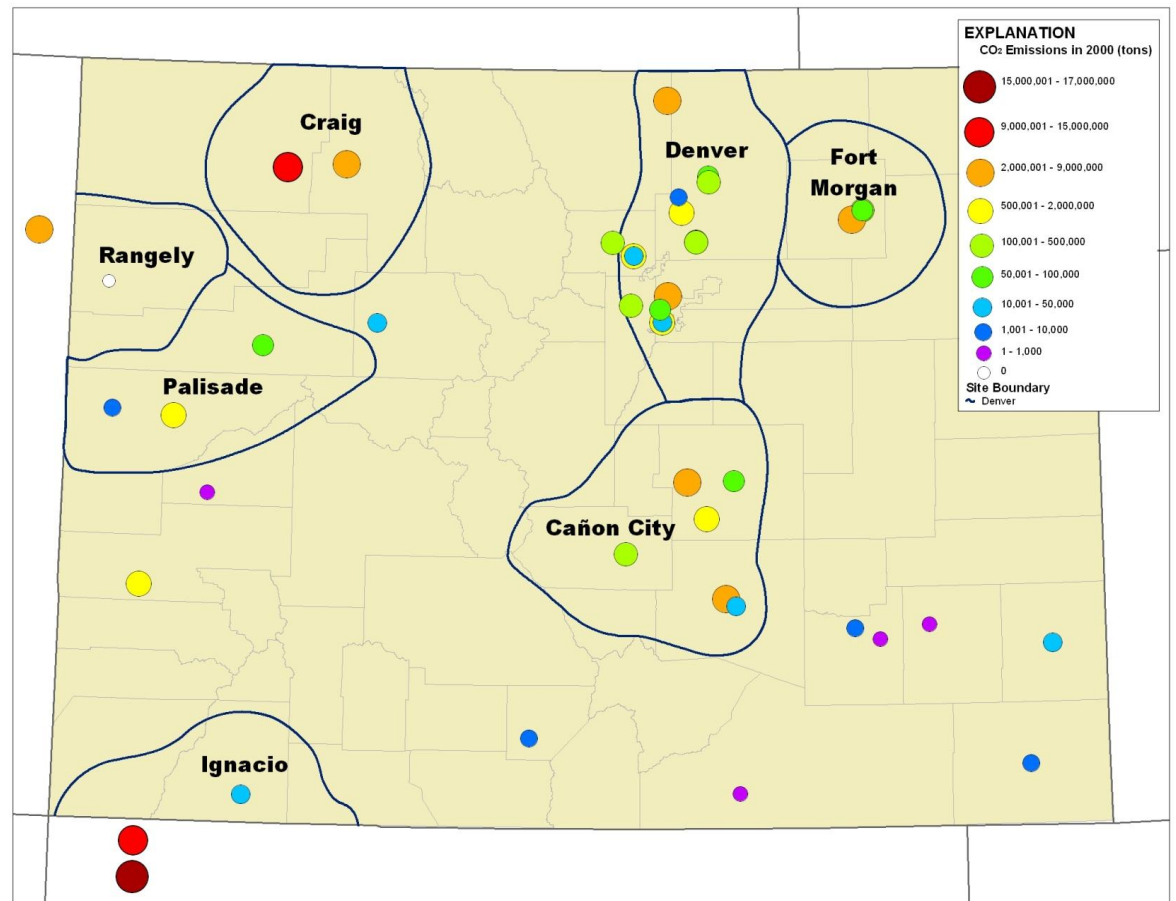

85 Mt total for 1999

from Vanessa Lintz, CGS

Expected Outcomes

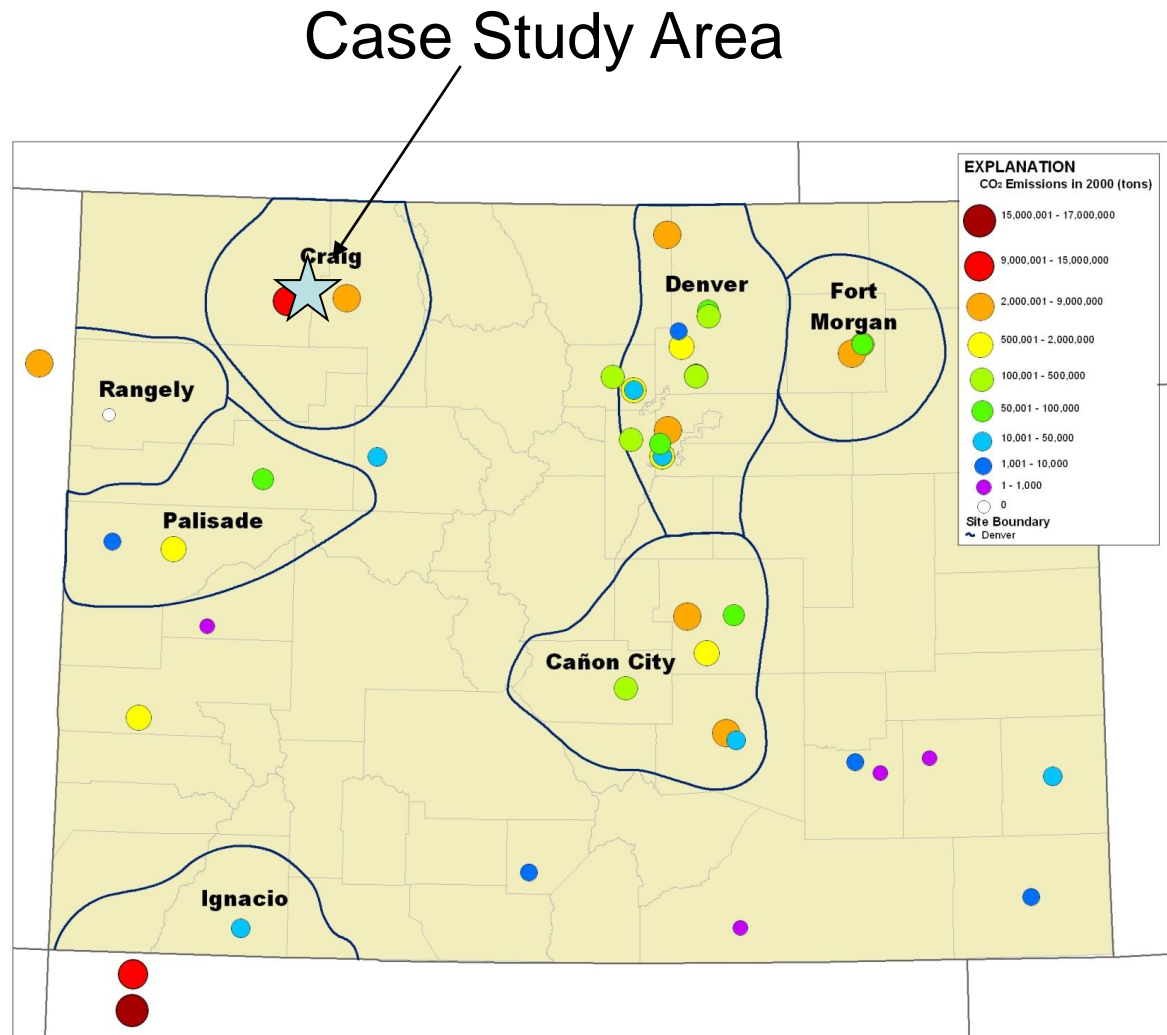

Optimize Capacity
Estimation:
Number of Years for
Specific Sources

Example: CO₂ Emissions in Colorado

Expected Outcomes

Optimize Capacity
Estimation:
Number of Years for
Specific Sources

Expected Outcomes

Optimize Capacity
Estimation:
Number of Years for
Specific Sources

Total Capacity Estimate:
(saline formations only)

$$\frac{680,000 \text{ Mtons}}{80 \text{ Mtons/yr}} \approx 8500 \text{ years}$$

Example: CO₂ Emissions in Colorado

2000 Emissions (Mt)		Storage Capacity - New Estimates		
		Oil & Gas	Coal Beds	Saline Aquifers
Canon City	9.4	0	493	122,118
Craig	14.4	123	11,059	46,209
Denver	14.1	557	602	129,138
Fort Morgan	4.1	164	0	43,700
Ignacio	31.5	186	2,809	92,142
Palisade	0.8	116	1,798	132,330
Rangely	3.4	740	1,037	102,579
Total	~80	1,886	17,798	~680,000

Expected Outcomes

EXAMPLE: Utah Emissions & Capacity

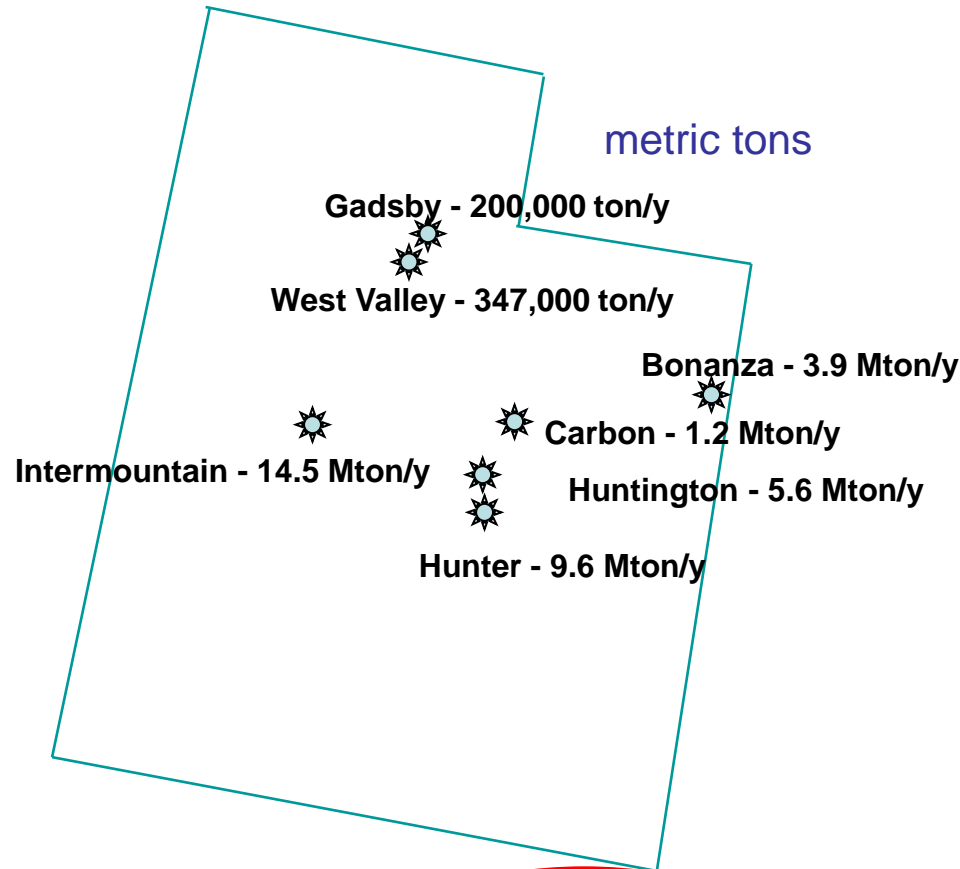

Sources: ~35 million metric tons CO₂ per year

Utah's CO₂ Sinks and Capacities:

Saline Formation CO₂ Storage Resource by State
(million metric tons)

State	Low CO ₂ Storage Resource	High CO ₂ Storage Resource
Arizona	199	752
Colorado	18,828	75,313
Kansas	8	9
Nebraska	87	348
New Mexico	33,054	132,215
Oklahoma	2	9
Texas	11,700	46,800
Utah	24,934	99,305
Wyoming	4,909	19,636

From Atlas II

99,305 Mtons
35 Mtons/yr ≈ 2800 years

Expected Outcomes

While we can evaluate capacity (in years of emissions) based on broad and regional-scale characterization, site-specific analyses are hampered by the high cost of high resolution characterization.

The point: the uncertainty and regional nature of these capacity estimates (in years) are significant and can be reduced!

Expected Outcomes

Some Critical Technical Goals and Outcomes:

- optimization of capacity estimation
- optimization of monitoring design - especially effective spatial coverage and survey/measurement frequency

Expected Outcomes

Better Characterization Provides More Effective Monitoring Design

Monitoring for Detecting CO₂ in non-Targets:

- Groundwater chemistry (non-target reservoirs)
- Surface CO₂ chamber flux
- Shallow CO₂ “piezometers” for sub-bio flux
- Remote sensing / LandSat Imaging
- Coupled process reservoir modeling

Monitoring for Tracking CO₂ Migration and Fate

- 2-D and/or 3-D seismic reflection
- Vertical seismic profiles (VSP)
- Crosswell seismic imaging
- Passive seismic monitoring/imaging
- Groundwater chemistry (target reservoir)
- In situ pressure, temperature measurements
- In situ bicarbonate detection
- Coupled process reservoir modeling
- Microgravity surveys

Focus monitoring on: resolved risk FEPS or unresolved areas

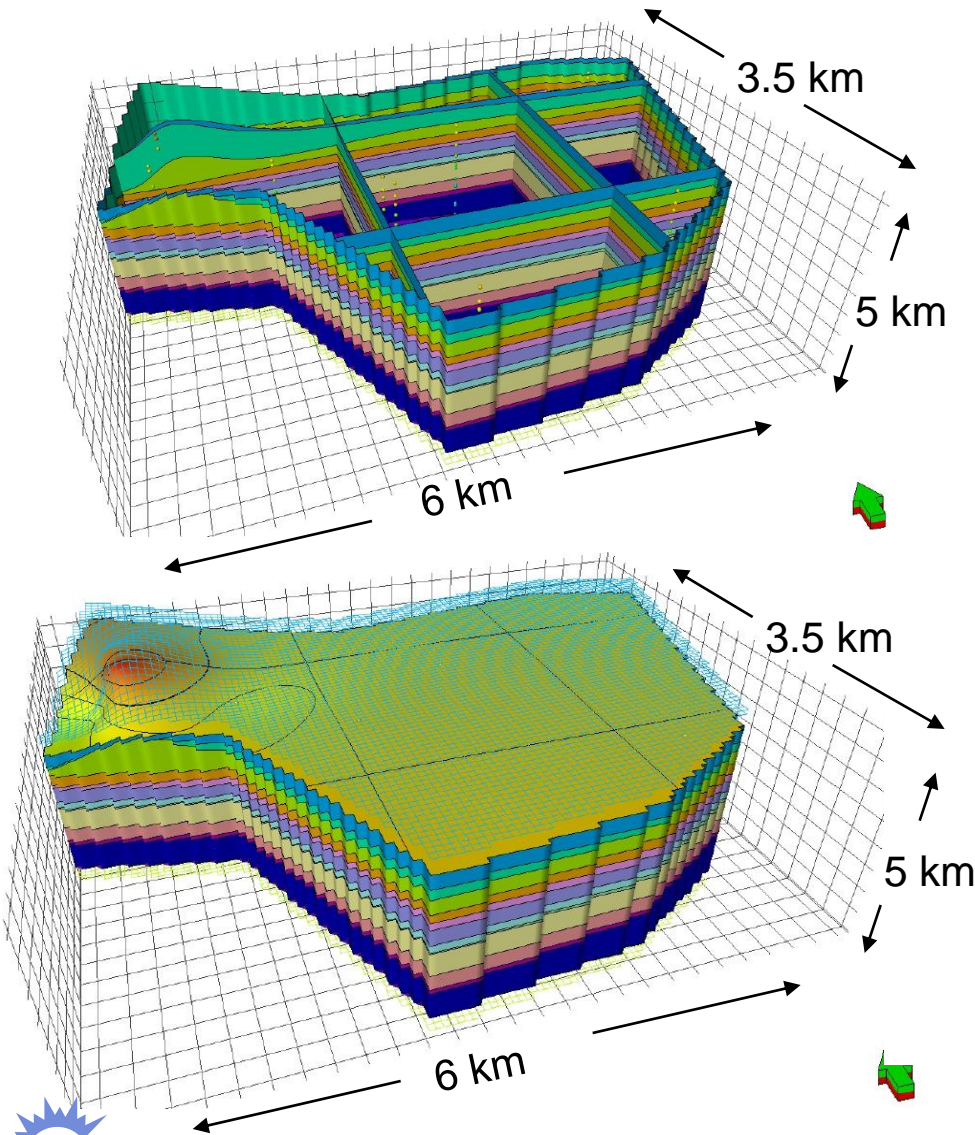

Expected Outcomes

Some Critical Technical Goals and Outcomes:

- optimization of capacity estimation
- optimization of monitoring design - especially effective spatial coverage and survey/measurement frequency
- optimization of simulation models - especially alignment of spatial and temporal scales of models with those of monitoring technologies

Expected Outcomes

- spatial and temporal resolution of models **must** match resolution of monitoring technologies - better characterization will help dramatically!

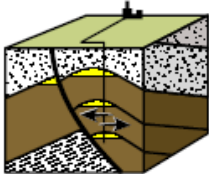

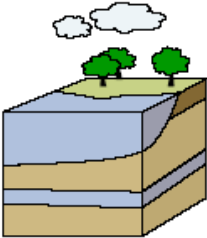

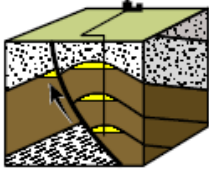

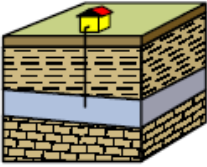

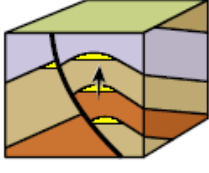

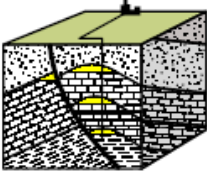

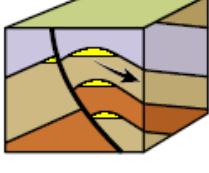

Expected Outcomes

Some Critical Technical Goals and Outcomes:

- optimization of capacity estimation
- optimization of monitoring design - especially effective spatial coverage and survey/measurement frequency
- optimization of simulation models - especially alignment of spatial and temporal scales of models with those of monitoring technologies
- optimization of risk assessment

Expected Outcomes

FEPs (Features, Events & Processes)	Major Risk Elements	Major PDF Elements
Well Bore Release 	Surface 	Probability that CO ₂ exceeds critical value over time in near surface soils, aqueous systems, and atmosphere
Fault or Fracture Release 	USDWs 	Probability that ground water chemistry is impacted over time
Seal Release 	Mineral Rights 	Probability that other resource reservoirs are impacted over time.
Lateral Migration 		

Modified from Guthrie et al.

- Improved site characterization = improved modeling, monitoring, and risk assessment

Top Goal and Deliverable

Top goal:

Based on a site-specific characterization of the case study site near Craig, CO, identify the most effective criteria for ranking potential storage sites throughout the region.

Top Deliverable:

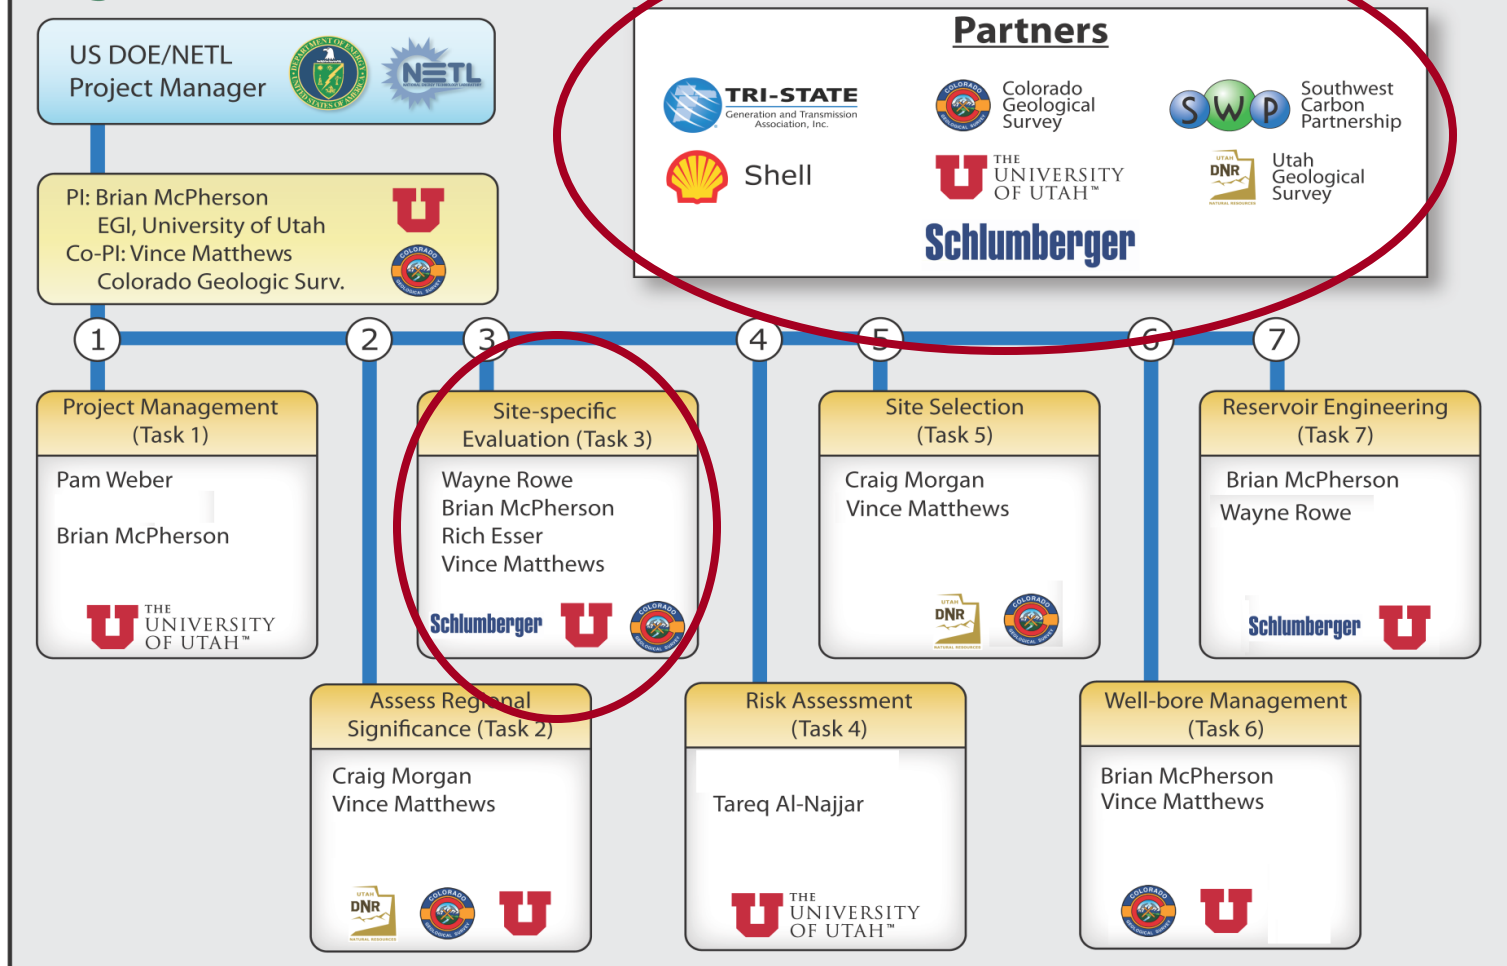

Final Site Characterization Plan and Protocols, Including Site-Selection Criteria

Presentation Outline

- Major Goals and Context (Why)
- Outcomes and Deliverables (What)
- Project Team and Plan (How)
- Budget and Cost-Share

Project Team and Plan

Characterization of Most Promising Sequestration Formations in the Rocky Mountain Region Organizational Chart

The Plan – Year 1

Characterize the Structure

Build database

Purchase seismic

Process & interpret seismic

Map surface structure

Shoot seismic line

Pick location for drill hole

Permit well

Project Team and Approach

Characterization of Most Promising Sequestration Formations in the Rocky Mountain Region

Organizational Chart

The Plan – Year 2

Drill Well

Core Shale

Core Sandstones

Sample Waters

Analyze Samples

CO₂ Injectivity Experiments on cores

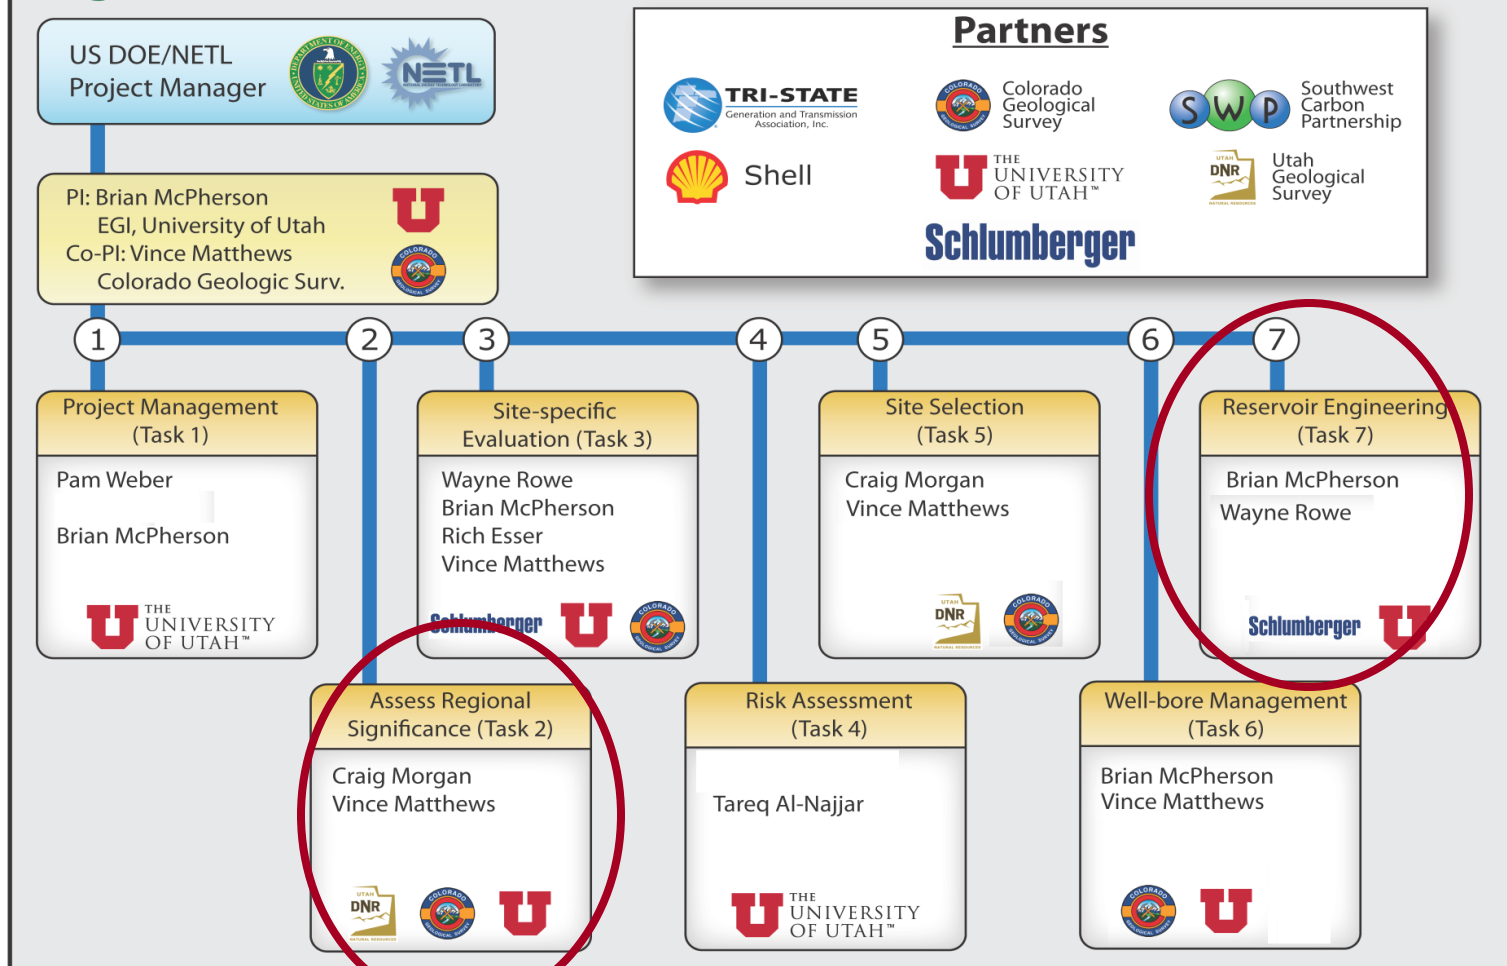

Continue Engineering Analysis & Reservoir Modeling

Project Team and Approach

Characterization of Most Promising Sequestration Formations in the Rocky Mountain Region

Organizational Chart

The Plan – Year 3

Extend results to Colorado Plateau (Region)

Continue Reservoir Simulation:

- Storage Volume

- CO₂ Migration

- Potential Leakage Pathways

- Optimization Studies

Final Site Characterization Plan and Protocols

Presentation Outline

- Major Goals and Context (Why)
- Outcomes and Deliverables (What)
- Project Team and Plan (How)
- Budget and Cost-Share

Budget

\$4.8 million Project

\$3.8 million Department of Energy

\$1.0 million from Partners (20%)

Cost-Share by Partners

Tri-State Generation and Transmission- \$300K

Shell Exploration & Production- \$200K

Colorado Geological Survey- \$162K

Schlumberger Carbon Management- \$150K

University of Utah - \$125K

Utah Geological Survey- \$22K

Arizona Geological Survey- \$19K

New Mexico Geological Survey- \$19K

Project Summary

1.0 Project Management (Plan, Organize, Meetings, Financials, Prog. Risk, Outreach/Education, Permitting)

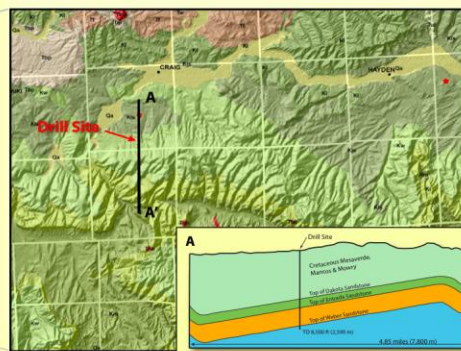

2.0 Regional Significance of Dakota, Entrada & Weber

Review available data (logs, studies, seismic) to determine capacity and injectivity (sustain 30 MMT of CO₂)

3.0 Site Specific Evaluation of Dakota, Entrada & Weber

Conduct field operations (drill/core well, fluid analyses). Use lab and field data to refine capacity, injectivity and containment.

Period	Formation / Member	Thickness (feet)	Unit
CRETACEOUS	Manitou Shale	1000	Seal
	Blue Gate Sh.	1000	Seal

TRIASSIC	Mancos Fm.	100	Seal
	Park City Fm.	100	Seal
TRIASSIC	Weber Sandstone	900	Reservoir

4.0 Conduct Risk Assessment

Create risk registry, identify site-specific FEPs, evaluate mitigation strategies and any cost-savings.

5.0 Develop Site Selection Criteria

Compile list of selection criteria based upon site-specific characterization results

6.0 Well bore management

Use data from Task 4.0 to prepare a management plan that will prevent leakage of CO₂ through artificial penetrations (well bores, mines, etc).

7.0 Maximize CO₂ Injection & Uses of Produced Fluids

Develop an engineering plan to optimize well placement for the region to maximize the amount of CO₂ storage based upon results of the characterization study. Develop a produced fluid disposal plan that will integrate mitigation strategies with respect to reservoir pressure stabilization.
